BOLT & QUARREL CLUB® INSTRUCTIONS FOR MEASURING BISON

All measurements must be made with a 1/4-inch wide flexible steel tape to the nearest one-eighth of an inch. Wherever it is necessary to change direction of measurement, mark a control point and swing tape at this point. Enter fractional figures in eighths, without reduction. Official measurements cannot be taken until the horns have air dried at a habitable room temperature for at least 60 days after the animal was killed. The 60-day drying period for a trophy that has been frozen or boiled begins the day it is removed from the freezer or boiling pot, or submersion in any liquid.

- A. Greatest Spread** is measured between perpendiculars at a right angle to the center line of the skull. **Greatest spread does not add into the final score.**
- B. Tip-to-Tip Spread** is measured between tips of horns. **Tip-to-tip spread does not add into the final score.**
- C. Length of Horn** is measured from the lowest point on underside over outer curve to a point in line with the tip. Use a straight edge, perpendicular to horn axis, to end the measurement, if necessary.
- D-1. Circumference of Base** is measured at right angle to axis of horn. Do not follow the irregular edge of horn; the line of measurement must be entirely on horn material.
- D-2-3-4. Divide measurement C** of longer horn by four. Starting at base, mark both horns at these quarters (even though the other horn is shorter) and measure the circumferences at these marks, with measurements taken at right angles to horn axis
